Modified exendin or an exendin agonist linked to one or more polyethylene glycol (PEG) polymers, modulate plasma glucose levels, useful for treating disorders such as diabetes and obesity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to extendins and their agonists which have been modified with molecular weight increasing agents such as polyethylene glycol (PEG). These can be used in the treatment of diabetes, obsety, impaired glucose tolerance, postprandial dumping syndrome, postprandial hyperglycaemia, eating disorders, insulin resistance syndrome, dyslipidaemia and to suppress glucagon secretion
resistance syndrome, dyslipidaemia and to suppress glucagon secretion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Extendin; agonist; diabetes; obesity; eating disorder; dyslipidaemia;
insulin-resistance syndrome; food intake.

```
Modified exendin or an exendin agonist linked to one or more polyethylene glycol (PEG) polymers, modulate plasma glucose levels, useful for treating disorders such as diabetes and obesity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Modified exendin or an exendin agonist linked to one or more polyethylene glycol (PEG) polymers, modulate plasma glucose levels, useful for treating disorders such as diabetes and obesity.
                                                                                                                                                                                                                                                                                        The present invention relates to extendins and their agonists which have been modified with molecular weight increasing agents such as polyethylene glycol (PEG). These can be used in the treatment of diabetes, obesity, impaired glucose tolerance, postprandial dumping syndrome, postprandial hyperslycaemia, eating disorders, insulin resistance syndrome, dyslipidaemia and to suppress glucagon secretion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to extendins and their agonists which have been modified with molecular weight increasing agents such as polyethylene glycol (PEG). These can be used in the treatment of diabetes, obesity, impaired glucose tolerance, postprandial dumping
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Extendin; agonist; diabetes; obesity; eating disorder; dyslipidaemia; insulin-resistance syndrome; food intake.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAB52945 Length: 28 February 4, 2005 13:20 Type: P Check: 657 Found using 'seq4' (mohamed337.key)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAB52949;
                                          AAB52948;
  Modified exendin or an exendin agonist linked to one or more polyethylene glycol (PEG) polymers, modulate plasma glucose levels, useful for treating disorders such as diabetes and obesity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to extendins and their agonists which have been modified with molecular weight increasing agents such as polyethylene glycol (PEG). These can be used in the treatment of diabetes, obesity, impaired glucose tolerance, postprandial dumping syndrome, postprandial hyperglycaemia, eating disorders, insulin resistance syndrome, dyslipidaemia and to suppress glucagon secretion
syndrome, postprandial hyperglycaemia, eating disorders, insulin
resistance syndrome, dyslipidaemia and to suppress glucagon secretion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Extendin; agonist; diabetes; obesity; eating disorder; dyslipidaemia; insulin-resistance syndrome; food intake.

ន្តដូន្ធន
                                                                                                                                                                                                           Modified exendin or an exendin agonist linked to one or more polyethylene glycol (PEG) polymers, modulate plasma glucose levels, useful for treating disorders such as diabetes and obesity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Modified exendin or an exendin agonist linked to one or more polyethylene glycol (PEG) polymers, modulate plasma glucose levels, useful for treating disorders such as diabetes and obesity.
                                                                                                                                                             The present invention relates to extendins and their agonists which have been modified with molecular weight increasing agents such as polyethylene glyool (PEG). These can be used in the treatment of diabetes, obesity, impaired glucose tolerance, postprandial dumping syndrome, postprandial hyperglycaemia, eating disorders, insulin resistance syndrome, dyslipidaemia and to suppress glucagon secretion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to extendins and their agonists which have been modified with molecular weight increasing agents such as polyethylene glycol (PEG). These can be used in the treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                diabetes; obesity; eating disorder; dyslipidaemia; syndrome; food intake.

```

```
Modified exendin or an exendin agonist linked to one or more polyethylene glycol (PEG) polymers, modulate plasma glucose levels, useful for treating disorders such as diabetes and obesity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to extendins and their agonists which have been modified with molecular weight increasing agents such as polyechylene glycol (PEG). These can be used in the treatment of diabetes, obesity, impaired glucose treatmee, postprandial dumping syndrome, postprandial hyperglycaemia, eating disorders, insulin resistance syndrome, dyslipidaemia and to suppress glucagon secretion
diabetes, obesity, impaired glucose tolerance, postprandial dumping syndrome, postprandial hyperglycaemia, eating disorders, insulin resistance syndrome, dyslipidaemia and to suppress glucagon secretion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Extendin; agonist; diabetes; obesity; eating disorder; dyslipidaemia; insulin-resistance syndrome; food intake.
                                                                                                                                                                                                        Check: 3183
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Type: P Check: 249

```

```
Modified exendin or an exendin agonist linked to one or more polyethylene glycol (PEG) polymers, modulate plasma glucose levels, useful for treating disorders such as diabetes and obesity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Modified exendin or an exendin agonist linked to one or more polyethylene glycol (PEG) polymers, modulate plasma glucose levels, useful for treating disorders such as diabetes and obesity.
                                                                                                                                                                                                                                                                                                          The present invention relates to extendins and their agonists which have been modified with molecular weight increasing agents such as polyethylene glycol (PEG). These can be used in the treatment of diabetes, obesity, impaired glucose terance, postprandial dumping syndrome, postprandial hyperglycaemia, eating disorders, insulin resistance syndrome, dyslipidaemia and to suppress glucagon secretion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to extendins and their agonists which have been modified with molecular weight increasing agents such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Extendin; agonist; diabetes; obesity; eating disorder; dyslipidaemia;
insulin-resistance syndrome; food intake.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Type: P Check: 590

Modified exendin or an exendin agonist linked to one or more polyethylene glycol (PEG) polymers, modulate plasma glucose levels, useful for treating disorders such as diabetes and obesity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to extendins and their agonists which have been modified with molecular weight increasing agents such as polyethylene glycol (PEG). These can be used in the treatment of diabetes, obesity, impaired glucose tolerance, postprandial dumping syndrome, postprandial hyperglycaemia, eating disorders, insulin resistance syndrome, dyslipidaemia and to suppress glucagon secretion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Disclosure; Fig 4; 119pp; English

                                                                                    AAB53035
                                            Modified exendin or an exendin agonist linked to one or more polyethylene glycol (PEG) polymers, modulate plasma glucose levels, useful for treating disorders such as diabetes and obesity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to extendins and their agonists which have been modified with molecular weight increasing agents such as polyechylene glycol (PBG). These can be used in the treatment of diabetes, obesity, impaired glucose tolerance, postprandial dumping syndrome, postprandial hyperglycaemia, eating disorders, insulin resistance syndrome, dyslipidaemia and to suppress glucagon secretion
  polyethylene glycol (PEG). These can be used in the treatment of diabetes, obesity, impaired glucose tolerance, postprandial dumping syndrome, postprandial hyperglycaemia, eating disorders, insulin resistance syndrome, dyslipidaemia and to suppress glucagon secretion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  diabetes; obesity; eating disorder; dyslipidaemia; syndrome; food intake.

                                                                                                                                                                                                                                                                                                                         Modified exendin or an exendin agonist linked to one or more polyethylene glycol (PEG) polymers, modulate plasma glucose levels, useful for treating disorders such as diabetes and obesity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to extendins and their agonists which have been modified with molecular weight increasing agents such as polyethylene glycol (PEG). These can be used in the treatment of diabetes, obesity, impaired glucose tolerance, postprandial dumping syndrome, postprandial hyperglycaemia, eating disorders, insulin resistance syndrome, dyslipidaemia and to suppress glucagon secretion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Check: 6321
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Type: P
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAB53039 Length: 38 February 4, 2005 13:20 Found using 'seq4' (mohamed337.key)

Modified exendin or an exendin agonist linked to one or more polyethylene glycol (PEG) polymers, modulate plasma glucose levels, useful for treating disorders such as diabetes and obesity.

Disclosure; Fig 4; 119pp; English

The present invention relates to extendins and their agonists which have

The invention relates to a new method for evaluating beta-cell secretory capacity in an individual, or responsiveness of a beta-cell to glucose, comprising the administration of glucose and glucagon-like peptide-1 (GLP -1) or its biologically active analogues. The response in the individual to is then measured against the standard response of a healthy individual to determine if the individual has impaired beta-cell function. The method is useful for detecting impaired beta-cell function in an individual, and is particularly useful for diagnosing impaired glucose tolerance (IGT) and non-insulin-dependent (FYPP II) diabetes. The method is a rapid test of beta-cell function, which is a marker for impaired glucose tolerance. Unlike prior methods, the method is reliable and without significant adverse side effects and/or patient pain and discomfort. The method also provides information about insulin secretory capacity, and is easy and reproducible. The present sequence represents a Gila monster venom GLP-1 analogue peptide referred to in the disclosure of the invention Evaluating beta-cell secretory capacity and responsiveness to glucose, useful for diagnosing impaixed glucose tolerance and diabetes, comprises employing glucagon-like-peptide-1 as a diagnostic test to determine beta-cell function. Exendin 3; Gila monster venom; GLP-1 analogue; glucagon-like peptide-1; type II diabetee; non-insulin dependent diabetes mellitus; NIDDM; beta-cell function; secretory capacity; impaired glucose tolerance; IGT; beta-cell stimulatory test; diagnostic test; insulinotropic. been modified with molecular weight increasing agents such as polyethylene glycol (PEG). These can be used in the treatment of diabetes, obesity, impaired glucose tolerance, postprandial dumping syndrome, postprandial hyperglycaemia, eating disorders, insulin resistance syndrome, dyslipidaemia and to suppress glucagon secretion Type: P Check: 7441 match found in sequence: aab60252 ; Gila monster venom GLP-1 analogue, exendin 3. The invention relates to a new method for evaluating beta-cell secretory capacity in an individual, or responsiveness of a beta-cell to glucose, comprising the administration of glucose and glucagon-like peptide-1 (GLP-1) or its biologically active analogues. The response in the individual is then measured against the standard response of a healthy individual determine if the individual has impaired beta-cell function. The method is particularly useful for diagnosing impaired blucose tolarance (IGT) and non-insulin-dependent (type II) diabetes. The method is a rapid test of beta-cell function, which is a marker for impaired glucose tolerance. Unlike prior methods, the method is reliable and without significant adverse side effects and/or patient pain and discomfort. The method also provides information about insulin secretory capacity, and is easy and reproducible, The present sequence represents a Gila monster venom GLP-1 analogue peptide referred to in the disclosure of the invention

```
The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mallitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin secretion. In contrast, in a normal pregnancy, both insulin resistence and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive of isorders such as pre-clampsia, and urinary tract infections. GDM regults in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocateseamia, hypomagnesemia, polycythaemia, hyporalirubinaemia, and subsequent childhood and adolescent obesity.

Exendins are peptides from the salivary secretions of the Gila monster of exendin-4) and the Maxican beaded lizard (exendin-4) and the Maxican beaded lizard (exendin-4) and the Maxican beaded lizard which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents exendin-3 cemptying and reduce appetite. The present sequence represents exendin-3 cemptying and reduce appetite. The present sequence represents exendin-3 cemptying and reduce appetite. The present sequence represents exendin-3 cemptying and reduce appetite. The present sequence represents eventin-3 cemptying and reduce appetite in specifically claimed for the contraction of the contrac
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.
                                                                                                                                                                                                                                                                           Exendin-3; gestational diabetes mellitus; GDM; insulin resistance; pregnancy complication; neonatal abnormality; blood glucose modulator; insulinotropic; anorectic; Mexican beaded lizard.

Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.

Claim 12; Page 11; 133pp; English.

cendin agonist (AAB64185-B64368) for treating pregnancy, and indeptes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube disorders, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnessemia, polycytheemia, hyperbilirubinaemia, and subsequent childhood and adolescent obesity.

Exendins are peptides from the alivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit homology with several members of the glucagon-like peptide family, particularly GIP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged effect on blood glucose, and, unlike conventional contrain the reapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents exendin-4 in the gila monster, which is specifically claimed for use in the The invention relates to the use of an exendin (AAB64181-B64182) or an nvention

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mealitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion increase. GDM pregnancy, both a sesociated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnesaemia, polycythaemia, byperbilirubinaemia, and subsequent childhood and adolescent obesity. Exendins are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit
GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a specifically claimed exendin agonist, which is based upon the sequence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Exendin agonist, gestational diabetes mellitus, GDM; insulin resistance, pregnancy complication, neonatal abnormality; blood glucose modulator; insulinotropic; anorectic; exendin-4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.
                                                                                                                                                                                                           Type: P Check: 9131

Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, Example 2; Fig 1A; 133pp; English. especially in a human.

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and iss due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both associated with complications in both the mother and the foctus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypomagnesaemia, polycythaemia, hyperbilirubinaemia, and subsequent childhood and adolescent obesity. CCCCCCCCCCXXXX4444X4X4X4X4X4X4X6X88X4444X4X4X4X4X

Exendins are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit homology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional limulin therapy, should not cause weight gain, as they inhibit agastric emptying and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-4

cerendin agonist (AAB64185-De64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the feetus. Women with GDM have increased rates of Casarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of meometal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnessemia, polycythaemia, hyporalcaemia, hypomagnessemia, polycythaemia, hyperbilirubinaemia, and subsequent childhood and adolescent obesity.

Exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit homology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin-4 angulation which is based upon the sequence of exendin-4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Exendin agonist; gestational diabetes mellitus; GDM; insulin resistance; pregnancy complication; neonatal abnormality; blood glucose modulator; insulinotropic; anorectic; exendin-4.
                                                                                                                                                            Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.
                                                                                                                                                                                                                                                                                                        invention relates to the use of an exendin (AAB64181-B64182) or an

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Gesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnesemia, polycytheemia, byporalcaemia, hypomagnesemia, polycytheemia, byperbilirubinaemia, and subsequent childhood and adolescent obesity. Exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit homology with several members of the glucagon-like peptide family, compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for an election of the members of the members and thus do not cross the placent and thus do not and such as everal members of the members and thus and contraind of the contraindicated for an election of the members and thus and allowed allowed allowed and allowed and allowed allowed allowed and allowed allo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Exendin agonist; gestational diabetes mellitus; GDM; insulin resistance; pregnancy complication; neonatal abnormality; blood glucose modulator; insulinotropic; anorectic; exendin-4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exandin agonist of the invention which is based upon the sequence of exendin-4
                                                                                                                                                                                                                                                  Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAB64204 Length: 39 February 4, 2005 13:19 Type: P Check: 9966

combination relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rate of foecal abnormalities such as neural tube castories such as pre-eclampsia, and unimary tract infections. GDM regnancies are hypoclycaemia, and elevated with an increased risk of neonatal morbidites such as hypoclycaemia, hypocalcaemia, hypomagnesaemia, polycythaemia, hypocalcaemia, hypomagnesaemia, polycythaemia, hyporalcaemia, hypomagnesaemia, polycythaemia, hyporalcaemia, and subsequent childhood and adolescent obesity. Exendins are peptides from the salivary secretions of the Gila monster of exendin-4) and the Mexican beaded lizard (exendin-3) which sexial members of the glucagon-like peptide family, homology with several members of the glucagon-like peptide family, homology with several members of the glucagon-like peptide family, homology with several members of the glucagon-like peptide family, compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin-gaonist of the invention which is based upon the sequence of exendin-4
                                                                                                                                                                                                                                                                                          Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject,
                                                                                                                                                                                                                                                                                                                                                                                              Example 16; Fig 1B; 133pp; English.

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64168) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocapleseania, polycythaemia, hypocapleseania, polycythaemia, chyperbilirubinaemia, and subsequent childhood and adolescent obesity. Exendine are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional include appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-4
                                                                                                                                                                                                                                                                                     Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject,
                                                                                                                                                                                                                                                                                                                                                                               Example 17; Fig 1B; 133pp; English.

Exendin agonist; gestational diabetes mellitus; GDM; insulin resistance; pregnancy complication; neonatal abnormality; blood glucose modulator; insulinotropic; anorectic; exendin-4. Exendin agonist, SEQ ID NO:27.

27-MAR-2001 (first entry)

Heloderma suspectum Synthetic.

```
cendin agonist (AAB64185-Be4368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin recease. GDM pregnancies are associated with complications in both the mother and the feetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonaral morbidites cauch as hypoglycaemia, hypocalcaemia, hypomagnesaemia, polycythaemia, hypotalcaemia, polycythaemia, hypotalcaemia, polycythaemia, hypotalcaemia, polycythaemia, hypotalcaemia, polycythaemia, hypotalcaemia, polycythaemia, bythaemia, and adolescent obseity. Exendins are peptides from the salivary secretions of the Gila monster (exendin-3) and the Maxican beaded lizard (exendin-3) which exhibit homology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinotropic effects. Unlike the common and account and the contraindicated for the common and account and the common account and the contraindicated for the common account and the contraindicated for the contraindicated 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               GDM, exending and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      invention relates to the use of an exendin (AAB64181-B64182) or an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 emptying and reduce appetite. The present sequence represents a exendinagonist of the invention which is based upon the sequence of exendin-4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                4, 2005 13:19 Type: P Check: 135

```
combination relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion increase. GDM pregnancy, both cinsulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tubes defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnesemia, polycythaemia, hyporaliurbinaemia, and subsequent childhood and adolescent obesity. Exendin are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cause severe prolonged hypodlycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional consults about any represents and reduce appetite. The present sequence represents a exendin emptying and reduce appetite. The present sequence represents a exendin-4 agonist of the invention which is based upon the sequence of exendin-4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAB64208 Length: 39 February 4, 2005 13:19 Type: P Check: 9696 Found using 'seq4' (mohamed337.key)

                                                                                                                                                                                                                                                                                                                                                                                                               Hiles R,
AXXXEX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDW) in a patient. GDM arises duting pregnancy, and is due to a combination of increased insulin secretion increase. GDM pregnancy, both increase insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM regults in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, polycoalcaemia, polyco

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tuber sells and is associated with an increased risk of neonatal morbidites such as hypoglycaenia, hypomagnessemia, polycythaemia, hyporallirubineamia, and subsequent childhood and adolescent obesity. Exendins are peptides from the salivary secretions of the Gila monster (exendin-3) and the Mexican beaded lizard (exendin-3) which exhibit homology with several members of the glucagon-like peptide family, permitted and exendin-4) and have similar insulinotropic effects. Unlike the common exending and exendin arminia and exendin arminia and exendin amonter and thus of the glucagon-like peptide family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-
Exendin agonist; gestational diabetes mellitus; GDM; insulin resistance; pregnancy complication; neonatal abnormality; blood glucose modulator; insulinotropic; anorectic; exendin-4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAB64210 Length: 39 February 4, 2005 13:19 Type: P Check: 9365 Found using 'seq4' (mohamed337.key)

combination relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistence and a diminished ability to increase insulin resistence and a diminished ability to increase insulin secretion increase. GDM pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as newral tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocaphesemia, polycythaemia, hypocaphicuses from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-6) which exhibit compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agoniets do not cross the placenta and thus do not cause severe prolonged hypodylycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional complying and reduce appetite. The present sequence represents a exendin-9 agonist of the invention which is based upon the sequence of exendin-4
                                                                                                                           Exendin agonist; gestational diabetes mellitus; GDM; insulin resistance; pregnancy complication; neonatal abnormality; blood glucose modulator; insulinotropic; anorectic; exendin-4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Example 23; Fig 1B; 133pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                  07-DEC-2000.
   cx The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes metalitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistence and a diminished ability to increase insulin resistence and a diminished ability to increase insulin resistence and a diminished ability to increase insulin resistence and a normal pregnancy, both thankin resistence and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnessemia, polychlaemia, hyporaglosand, hyporagnessemia, polycoalcaemia, hypomagnessemia, polychlaemia, hyporaglosand, polycoalcaemia, hypomagnessemia, polycoalcaemia, hypomagnessemia, polychlaemia, hypomagnessemia, polychlaemia, hypomagnessemia, polychlaemia, hypomagnessemia, polychlaemia, hypomagnessemia, polychlaemia, hypomagnessemia, polycoalcaemia, polyco
                                                          Exendin agonist; gestational diabetes mellitus; GDM; insulin resistance; pregnancy complication; neonatal abnormality; blood glucose modulator; insulinotropic; anorectic; exendin-4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject,

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes candin agonist (AAB64185-B64368) for treating pregnancy, and is due to a mellitus (GDM) in a patient. GDM arises during pregnancy, both includes (GDM) in a patient. GDM arises and a diminished ability to combination of increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive cassociated with a primary tract infections. GDM regults in an elevated rate of foecal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypomagnesaemia, polycythaemia, chyperbilirubinaemia, and subsequent childhood and adolescent obesity. Exendins are peptides from the salivary secretions of the Gila monster (Exendin 4) and the Mexican beaded lizard (exendin-4) and the Mexican beaded lizard (exendin-4) and the Mexican beaded lizard (exendin-4) and the Mexican beaded lizard (exendin-3) which several members of the glucagon-like peptide family, homology with several members of the glucagon-like peptide family, compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placent and thus do not cause severe prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The passed upon the sequence of exendin-4 emptying and reduce appetite. The passed upon the sequence of exendin-4.
                                                                                                                          Exendin agonist, gestational diabetes mellitus; GDM; insulin resistance; pregnancy complication; neonatal abnormality; blood glucose modulator; insulinotropic; anorectic; exendin-4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               exendins or exendin agonists for lowering or reducing blood elevels and treating gestational diabetes mellitus in a subject,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Example 24; Fig 1B; 133pp; English.
                                                                                     Exendin agonist, SEQ ID NO:33.

Exendin agonist, gestational diabetes mellitus, GDM; insulin resistance, pregnancy complication; neonatal abnormality; blood glucose modulator; insulinotropic; anorectic; exendin-4. exendins or exendin agonists for lowering or reducing blood elects and treating gestational diabetes mellitus in a subject, Example 25; Fig 1B; 133pp; English. AAB64214 standard; peptide; 39 AA. Exendin agonist, SEQ ID NO:34. 23-MAY-2000; 2000WO-US014231. 99US-00323867. 27-MAR-2001 (first entry) (AMYL-) AMYLIN PHARM INC. glucose levels and tredespecially in a human. Hiles R, Prickett KS; WPI; 2001-137634/14. Heloderma suspectum WO200073331-A2. 01-JUN-1999; 07-DEC-2000. Synthetic. AAB64214; Use of

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes (CC exendin agonist (AAB64185-B64368) for treating pregnancy, and is due to a combination of increased insulin secretion increase. Gibb pregnancy, both increase insulin secretion increase. Gibb pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive Gibborders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tuber defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnessemia, polycythaemia, compounds are peptides from the salivary secretions of the Gila monster (C exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit compounds used to treat type 2 diabetes, which are contraindicated for GDM exendins and exendin agonists do not cross the placenta and thus do compounds used effect on blood glucose, and, unlike conventional concentration and reduce appetite. The present sequence represents a exendin insulin therapy, should not cause weight gain, as they inhibit gastric general reduce appetite. The present sequence represents a exendin agonist of the present sequence represents a exendin constant of the invention which is based upon the sequence of exendin-4).

Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.

Example 26; Fig 1B; 133pp; English.

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes melitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin resistance and a diminished ability to increase insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foctus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated exte of foctal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal worbidites such as hypoglycaenia, hyporaglessemia, polycythaemia, hyporaglycaenia, hyporaglessemia, hyporagloraenia, hyporaglessemia, polycythaemia, hyporaglin-thildhood and adolescent obesity. Exendins are peptides from the salivary secretions of the Gila monster (exendin-1) and the Mexican beaded lizard (exendin-2) which exhibit particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged effect on blood glucose, and, unlike conventional potent and prolonged effect on blood glucose, and, unlike conventional complying and reduce appetite. The present sequence represents a exendin-4 agonist of the invention which is based upon the sequence of exendin-4

Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.

Example 29; Fig 1B; 133pp; English.

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes candin agonist (AAB64185-B64368) for treating gestational diabetes combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GMD pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rate of foetal abnormalities such as neural tube cassociated with an increased risk of neonatal tube celests, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnesaemia, polycythaemia, chyperbilirubinaemia, and subsequent childhood and adolescent obesity. Exendins are peptides from the salivary secretions of the Gila monster of exendin-4) and the Maxican beaded lizard (exendin-3) which several members of the glucagon-like peptide family. Compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placent and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a contrainin therapy, should not cause weight gain, as they inhibit gastric emprying and reduce appetite. The present sequence represents a exendin-3 contrainic cemptying and reduce appetite. The present sequence of exendin-4

The invention features to the use of an exeminal (Arbostos) of an exeminal exeminal diabetes candin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancy, both insulin resistance and insulin secretion. In contrast, in a normal pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Casearian delivery, hypertensive disorders such as pre-eclampsia, and uninary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of menatal morbidites could as hypoglycaemia, hypocalcaemia, hypomagnesaemia, polycythaemia, hyporalcaemia, hypomagnesaemia, polycythaemia, hypocalcaemia, hypomagnesaemia, hypoglycaemia, hypoglycaemia, hypomagnesaemia, hypoglycaemia, hypoglycaemia, and the Baricae, type compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for CGDM, exendins and exendin agoniate do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a coptent and prolonged effect on blood glucose, and, unlike conventional contention the rapp, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The passed upon the sequence of exendin-4, and passed upon the sequence of exendin-4. The invention relates to the use of an exendin (AAB64181-B64182) or an

Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.

Claim 13; Page 13; 133pp; English.

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64168) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin secretion increase. GDM pregnancies are insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-celampsla, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites cuch as hypoglycaemia, hypomagnessemia, polycythaemia, hyporallirubinaemia, and subsequent childhood and adolescent obesity. Exendins are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which several members of the glucagon-like peptide family, homology with several members of the glucagon-like peptide family, compounds used to treat type 2 diabetes; which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a specifically claimed exendin agonist, which is based upon the sequence of exendin-4

combination agonier (AAB64185-BEA1368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both combination of increased insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Cesearian delivery, hypertensive clusorders such as pre-eclampsia, and urinary tract infections. GDM regnancies in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites cluck as hypoglycaemia, hypocalcaemia, hypomagnesaemia, polycythaemia, hyperbilirubinemia, and subsequent childhood and adolescent obssity. Exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit paticularly GIP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Exendin agonist; gestational diabetes mellitus; GDM; insulin resistance; pregnancy complication; neonatal abnormality; blood glucose modulator; insulinotropic; anorectic; exendin-4.
potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64168) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive with GDM have increased rates of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnessemia, polycythaemia, hypotabiliruhiaemia, and subsequent childhood and adolescent obesity.

Exendins are peptides from the salvary secretions of the Glia monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit
GDM, exending and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Exendin agonist, gestational diabetes mellitus, GDM, insulin resistance, pregnancy complication, neonatal abnormality, blood glucose modulator, insulinotropic, anorectic, exendin-4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject,

particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional linulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-4

Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.

Example 38; Page 49; 133pp; English

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes (mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to combination of increased insulin resistence and a diminished ability to increase insulin resistence. In contrast, in a normal pregnancy, both insulin resistence and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites cuch as hypogalycaemia, hypocalcaemia, hypocalcaemia, polycythaemia, hypocalcaemia, polycythaemia, hyposalcus second adolescent obseity. Exendins are peptides from the salivary secretions of the Gila monster

Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.

Example 39; Page 49; 133pp; English

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mailitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM regults in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnesaemia, polycythaemia,

hyperbilirubinaemia, and subsequent childhood and adolescent obesity. Exendins are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit homology with several members of the glucagon-like peptide family, particularly GiP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.

Example 41; Page 50; 133pp; English

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Cassarian delivery, hypertensive

```
results in an elevated rate of foctal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypomagnessemia, polycythaemia, hypomagnessemia, polycythaemia, hypomagnessemia, polycythaemia, and subsequent childhood and adolescent obseity. Exendins are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit homology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional contains and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-4
disorders such as pre-eclampsia, and urinary tract infections. GDM

Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.

Example 43; Page 51; 133pp; English.

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64188-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insuln resistance and a diminished ability to

increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foctus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tubes defects, and is associated with an increased risk of neonatal morbidites uch as hypoglycaemia, hypocalcaemia, hypomagnesaemia, polycytheemia, hyperbilirubinaemia, and subsequent childhood and adolescent obesity. Exendine are peptides from the salivary secretions of the dila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit homology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendin and exendin agonists do not cross the placent and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-4 \$

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mallitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin secretion increase. GDM pregnancies are insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive associated with complications in both the mother and the foetus. Women with GDM have increased rates of foetal abnormalities such as neural tube castociates and is associated with an increased risk of neonatal morbidites results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites contrains are peptides from the salivary secretions of the Gila monster case peptides from the salivary secretions of the Gila monster case peptides from the salivary secretions of the Gila monster case peptides from the salivary secretions of the Gila monster compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin-agonist of the invention which is based upon the sequence of exendin-4

Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.

Example 50; Page 55; 133pp; English

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and uxinary tract infections. GDM cesults in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnessemia, polycythaemia, hyporalcaemia, hypomagnessemia, polycythaemia, Exendins are peptides from the salivary secretions of the Gila monster (exendin-4) and the Maxican beaded lizard (exendin-2) which exhibit homology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin some consets the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-4

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes medilitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increase insulin reseistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive with GDM have increased rates of Caesarian delivery, hypertensive compounds as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tubes caecuts in an elevated rate of foetal abnormalities such as neural tubes caecuts, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocmagnessaemia, polycythaemia, hyporallirubinaemia, and subsequent childhood and adolescent obesity.

Exendins are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which serving the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin-4 agonist of the invention which is based upon the sequence of exendin-4
                                                                                                                                                                                                                                                                                                                                                                                                                                    exendins or exendin agonists for lowering or reducing blood levels and treating gestational diabetes mellitus in a subject,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Example 52; Page 56; 133pp; English.

compounds used the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (CDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancis are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM regults in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnessemia, polycythaemia, hyperbllitubinaemia, and subsequent childhood and adolescent obesity. Exendine are peptides from the allivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit the particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contrained and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-4

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB6418-B64368) for treating gestational diabetes candin agonist (AAB6418-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to combination of increased insulin resistance and adiminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Casarian delivery, hypertensive with GDM have increased rate of foetal abnormalities such as neural tube cesults in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypomagnesaemia, polycythaemia, chyperbilirubinaemia, and subsequent childhood and adolescent obesity. Compounds are peptides from the salivary secretions of the Gila monster (exendin at and the Mexican beaded lizard (exendin-3) which exhibit compounds used to treat type 2 diabetes, which are contraindicated for Compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for Compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for Compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which and which gastric emprying and reduce ap Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human. Heloderma suspectum SXXXXXXXXXXXXX

```
The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes malitius (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin secretion increase. GDM pregnancies are insulin resistence and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foctus. Women with GDM have increased rates of Caesarian delivery, hypertensive with GDM have increased rates of Caesarian delivery, hypertensive caisorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal annormalities such as neural tuesuch as hypoglycaemia, hypomagnesaemia, polycythaemia, hyperbillirubinaemia, and subsequent childhood and adolescent obesity. Exendins are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which service and the Mexican beaded lizard (exendin-3) which schibit homology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinocropic effects. Unlike the COMPW, exendins and exendin agonists do not cross the placenta and thus do not cross the placent and eventy and the wealth appealing the newborn. They have a potent and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-4 emptying and reduce appetite. The present sequence of exendin-4
Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAB64243 Length: 38 February 4, 2005 13:19 Type: P Check: 5894 Found using 'seq4' (mohamed337.key)

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM cesults in an elevated rate of foetal abnormalities such as neural tubes defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocralesed risk of neonatal morbidites such as hypoglycaemia, polycythaemia, hyporagnesaemia, polycythaemia, chyperbilirubinaemia, and subsequent childhood and adolescent obesity. Exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit homology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindatated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged bypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin-4 agonist of the invention which is based upon the sequence of exendin-4
                                                                                                                                                                                                                                                                                                                                                                                                             exendins or exendin agonists for lowering or reducing blood e levels and treating gestational diabetes mellitus in a subject,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAB64244 Length: 37 February 4, 2005 13:19 Type: P Check: 3293 Found using 'seq4' (mohamed337.key)

Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.

Example 58; Page 59; 133pp; English.

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancts are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tuber results in an elevated rate of foetal abnormalities such as neural tuber as hypoglycaenia, hypocalcaemia, hypomagnesaemia, polycythaemia, hyporallitubinaemia, and subsequent childhood and adolescent obseity. Exendins are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit homology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinotropic effects. Unlike the common avancine and eventine and eventin GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-

cendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDW) in a patient GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foctus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnesemia, polycythaemia, hyperbilirubinaemia, and subsequent childhood and adolescent obesity. Exendine are peptides from the sallivary secretions of the cila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit homology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinctropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin supposed by polycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional membrane, severe prolonged by present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-4.
                  Exendin agonist; gestational diabetes mellitus; GDM; insulin resistance; pregnancy complication; neonatal abnormality; blood glucose modulator; insulinotropic; anorectic; exendin-4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            invention relates to the use of an exendin (AAB64181-B64182) or an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Example 59; Page 59; 133pp; English

Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.

Example 60; Page 60; 133pp; English

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes caredin agonist (AAB64185-B64368) for treating pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin resistance and a diminished ability to combination of increased insulin secretion increase. By pregnancy, both insulin resistance and a normal pregnancy, both cassociated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypocalcaemia, hypocalcaemia, hypocalcaemia, polycaelcaemia, hypocalcaemia, polycaemia, and subsequent childhood and adolescent obesity. Exendine are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit compony with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for CMP, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypodylycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin-4 agonist of the invention which is based upon the sequence of exendin-4

such as hypoglycaemia, hypocalcaemia, hypomagnesaemia, polycythaemia, hypocalcaemia, hypomagnesaemia, polycythaemia, hypocalcaemia, hypomagnesaemia, polycythaemia, byperbilirubinaemia, and subsequent childhood and adolescent obseity. Exendins are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit homology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites
                                                                                                         Exendin agonist; gestational diabetes mellitus, GDM, insulin resistance; pregnancy complication; neonatal abnormality; blood glucose modulator; insulinotropic; anorectic; exendin-4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to the use of an exendin (AAB64181-B64182) or an

of exendins or exendin agonists for lowering or reducing blood cose levels and treating gestational diabetes mellitus in a subject, especially in a human. Use

Example 62; Page 61; 133pp; English.

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mealitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the feetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnessemia, polycythaemia, hypomagnessemia, polycythaemia, chyperbilirubinaemia, and subsequent childhood and adolescent obesity. Exendins are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit homelogy with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exending and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-

```
The invention relates to the use of an exendin (AAB64181-B64182) or an exendin.agoniat (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion increase. GDM pregnancis are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM cefects, and is associated with an increased risk of neonatal tube cresults in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, polycamia, polycaemia, nad subsequent childhood and adolescent obesity. Exendins are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a copenit and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric agonist of the invention which is based upon the sequence of exendin-4).
                                                                                                                                                                                                                                              Exendin agonist; gestational diabetes mellitus; GDM; insulin resistance; pregnancy complication; neonatal abnormality; blood glucose modulator; insulinotropic; anorectic; exendin-4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.

Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.

Example 67; Page 63; 133pp; English.

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin resistance and a diminished ability to increase insulin rescretion. In contrast, in a normal pregnancy, both a subcider such as careful and increased rates of Caesarian delivery, hypertensive with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and uxinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypomagnesemia, polycythaemia, hyporalicalian, hypomagnesemia, polycythaemia, hyperbilitubinaemia, and subsequent childhood and adolescent obesity. Exendins are peptides from the salivary secretions of the cila monster (exendin-3) which and the Mexican beaded lizard (exendin-3) which exhibit homology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged effect on blood glucose, and, unlike conventional potent and prolonged effect on blood glucose, and, unlike conventional emptying and reduce appetite. The present sequence represents a exendin emptying and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-4

Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.

Example 68; Page 64; 133pp; English.

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-1864368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the feetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaenia, hypocaphaena, polychaenia, hypocaphaena, polychaenia, hypocaphist pre-eclampsia, plant with good and adolescent obseity. Exendins are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit chomology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes which are contraindicated for the diabetes and contraindicated for the diabetes and the diabetes of the diabetes. GDM, exending and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-4

exendin agonist (AAB64185-B64368) for treating gestational diabetes menlitus (5DM) in a patient. GDM arises during pregnancy, and iss due to ancombination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancy, both associated with complications in both the mother and the foctus. Women with GDM have increased rates of Caesarian delivery, hypertensive alsorders such as pre-eclampsia, and uninary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnesaemia, polycythaemia, hyperbilirubinaemia, and subsequent childhood and adolescent obesity. Exendins are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit homology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinotropic effects. Unlike the invention relates to the use of an exendin (AAB64181-B64182) or an

Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.

Example 78; Page 68; 133pp; English.

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women

```
with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM cesults in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnesemia, polycythaemia, hyporallirubinaemia, and subsequent childhood and adolescent obesity. Exendins are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit homology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional prolonged effect on blood glucose, and, unlike conventional menting and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-4

Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human

Example 87; Page 73; 133pp; English

compinite force to the use of an executal (Arbaylor) of an executal of increased insulin resistance and insulin resistance and insulin secretion increase. GDW pregnancy, both insulin resistance and insulin secretion increase. GDW pregnancies are associated with compileations in both the mother and the foetus. Women with GDW have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDW executs in an elevated rate of foetal abnormalities used as neural mubes of feets, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnessemia, polycythaemia, hyperbilirubinaemia, and subsequent childhood and adolescent obesity.

Exendina are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit particularly GLP-1, and have similar insulinotropic effects, Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDW, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypodycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin engents of the invention which is based upon the sequence of exendin-4. The invention relates to the use of an exendin (AAB64181-B64182) or an

Exendin agonist; gestational diabetes mellitus; GDM; insulin resistance; pregnancy complication; neonatal abnormality; blood glucose modulator; insulinotropic; anorectic; exendin-4.

Heloderma suspectum

Synthetic

WO200073331-A2

```
The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating pregnancy, and is due to a combination of increased insulin pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin restration. In contrast, in a normal pregnancy, both insulin restrations in both the mother and the foctus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foctal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbities such as hypoglycaemia, hypocalcaemia, hypomagnessemia, polycythaemia, byperbilirubinaemia, and subsequent childhood and adolescent obesity.

Exendine are peptides from the salivary secretions of the dila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional infering and reduce appetite. The present sequence represents a exendin-4 agonist of the invention which is based upon the sequence of exendin-4
                                                                                                                                                                                                                                                                                      Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject,
                                                                                                                                                                                                                                                                                                                                                                          Example 91; Page 75; 133pp; English

The intention feature to the use of an exeminal (Anabetes) mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foctus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural nube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnessemia, polycythaemia, hyperbilirubinaemia, and subsequent childhood and adolescent obseity. Exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit homology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists on cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence of exendin-4 exendin-4 exendin-4 exendin-8 and exendin-8 and exendin-9 and reduce appetite. The present sequence of exendin-4 exendin-4 exendin-8 and exendin-8 and exendin-9 and

```
The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64868) for treating gestational diabetes entablities (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-clampsia, and urlnary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube a sociated with an increased risk of neonatal morbidites such as hypoglycaemia, hypomagnessemia, polycythaemia, hypomagnessemia, chedila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for contraint such as everes prolonged hypoglycaemia in the newborn. They have a contraint and new home.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Exendin agonist; gestational diabetes mellitus; GDM; insulin resistance; pregnancy complication; neonatal abnormality; blood glucose modulator;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendiagonist of the invention which is based upon the sequence of exendin-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAB64281 Length: 28 February 4, 2005 13:19 Type: P Check: 249 Found using 'seq4' (mohamed337.key)

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin resistance and a diminished ability to increase insulin resistance and insulin secretion increase. GDM pregnancies are susciated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypomagnessemia, polycythaemia, hyporablirubinaemia, and subsequent childhood and adolescent obesity.

Exendins are peptides from the salivary secretions of the dila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     homology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-4
                                                                                                                                                                                                                                                                                                                                                                                                                    Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human.
insulinotropic; anorectic; exendin-4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Example 100; Page 80; 133pp; English.

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a increase insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural much chyperbilizubinaemia, hypocalcaemia, hypomagnessemia, polycythaemia, hyporbilizubinaemia, and subsequent childhood and adolescent obesity. Exendins are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit homology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite.                                                                                                                                                                                                                                                    07-DEC-2000
                                                                                                                                                         Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                    Hiles R,
```

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mealitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion in contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM cesults in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites such as hypoglycaemia, hypocalcaemia, hypomagnessemia, polycythaemia, hyporalirubinaemia, and subsequent childhood and adolescent obesity. Exendins are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit

Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject,

Example 168; Page 114; 133pp; English.

especially in a human.

homology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-4

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes mellitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin insulence and insulin secretion. In contrast, in a normal pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     homology with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for GDM, exending and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-4
                                                                                                                                  Exendin agonist; gestational diabetes mellitus; GDM; insulin resistance;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 such as hypoglycaemia, hypocalcaemia, hypomagnesaemia, polycythaemia, hyperbilirubinaemia, and subsequent childhood and adolescent obesity. Exendins are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit
                                                                                                                                                       pregnancy complication; neonatal abnormality; blood glucose modulator; insulinotropic; anorectic; exendin-4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Example 172; Page 116; 133pp; English.

Exendin agonist; gestational diabetes mellitus; GDM; insulin resistance; pregnancy complication; neonatal abnormality; blood glucose modulator; insulinotropic; anorectic; exendin-4. Use of exendins or exendin agonists for lowering or reducing blood glucose levels and treating gestational diabetes mellitus in a subject, especially in a human. AAB64361 standard; peptide; 38 AA. Exendin agonist, SEQ ID NO:181. 99US-00323867. 23-MAY-2000; 2000WO-US014231 '(first entry) (AMYL-) AMYLIN PHARM INC. Hiles R, Prickett KS; WPI; 2001-137634/14. Heloderma suspectum WO200073331-A2. 01-JUN-1999; 27-MAR-2001 07-DEC-2000. Synthetic. AAB64361;

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes melitus (GDM) in a patient. GDM arises during pregnancy, and is due to a combination of increased insulin resistance and a diminished ability to increase insulin resistance and a diminished ability to increase insulin secretion increase. GDM pregnancies are associated with complications in both the mother and the foetus. Women with GDM have increased rates of Caesarian delivery, hypertensive disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foetal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal worbidites such as hypoglycaemia, hypocralcaemia, hypomagnesemia, polycythaemia, conventina, hypocralcaemia, hypomagnesemia, polycythaemia, hyporalcaemia, hypomagnesemia, polycythaemia, and subsequent childhood and adolescent obesity. Exendine are peptides from the salivary secretions of the cila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit compounds used to treat type 2 diabetes, which are contraindicated for compounds used to treat type 2 diabetes, which are contraindicated for GDM, exendins and exendin agonists do not cause severe prolonged bypoglycaemia in the newborn. They have a potent and prolonged effect on blood glucose, and, unlike conventional contraint reservable. They be present sequence represents a exendin emptying and reduce appetite. The present sequence represents a exendin-4 agonist of the invention which is based upon the sequence of exendin-4 Example 176; Page 118; 133pp; English.

exendins or exendin agonists for lowering or reducing blood elevels and treating gestational diabetes mellitus in a subject, especially in a human. glucose Use of

Example 180; Page 120; 133pp; English.

The invention relates to the use of an exendin (AAB64181-B64182) or an exendin agonist (AAB64185-B64368) for treating gestational diabetes combination of increased insulin resistance and a diminished ability to increase insulin resistance and a diminished ability to increase insulin secretion. In contrast, in a normal pregnancy, both insulin resistance and insulin secretion increase. GDM pregnancy, both associated with complications in both the mother and the foetus. Women with GDM have increased rates of Cacearian delivery, hypergnancies are disorders such as pre-eclampsia, and urinary tract infections. GDM results in an elevated rate of foctal abnormalities such as neural tube defects, and is associated with an increased risk of neonatal morbidites cuch as hypoglycaemia, hypocalcaemia, hypomagnessemia, polycythaemia, hyporallirubinaemia, and subsequent childhood and adolescent obesity. Exendine are peptides from the salivary secretions of the Gila monster (exendin-4) and the Mexican beaded lizard (exendin-3) which exhibit homelogy with several members of the glucagon-like peptide family, particularly GLP-1, and have similar insulinotropic effects. Unlike the compounds used to treat type 2 diabetes, which are contraindicated for compounds used exercine and exendin agonists do not cross the placenta and thus do not cause severe prolonged hypoglycaemia in the newborn. The perpendict. potent and prolonged effect on blood glucose, and, unlike conventional insulin therapy, should not cause weight gain, as they inhibit gastric emptying and reduce appetite. The present sequence represents a exendin agonist of the invention which is based upon the sequence of exendin-4

Novel peptide agonist of Glucagon-like peptide, useful for decreasing the level of blood glucose and for treating diseases like diabetes, obesity and eating disorders.

Claim 22; Page 66; 83pp; English.

The present sequence is a peptide conjugate comprising a peptide (X)
which is an exendin at least 90 % homologous to exendin-4, a variant of
exendin comprising 1-5 deletions at positions 34-39 or a Lys at position
40 having a lipophilic substituent, a glucagon-like peptide (GLP-1) (756) or GLP-1 (7-37) having a substitution of D-Ala, Gly or alpha-amino
constituent, and Z, a peptide sequence of 4-20 amino acide covalently
bound to the variant. Each amino acid in Z is selected from A, L, S, T,
Y, N, Q, D, G, K, R, H, M, Orn, and amino acid units of formula -NHC(R1) (R2)-C(=0)-. R1 and R2 are selected from H, Cl-6-alkyl, phenyl and
phenyl-methyl, where Cl-6-alkyl is optionally substituted with 1-3
cubstituents selected from halogen, hydroxy, amino, cyano, nitro,
sulfono, and carboxy, and phenyl and phenylmethyl are optionally
cubstituted with 1-3 substituents selected from Cl-6-alkyl, C2-6-alkenyl,
cubstituted with 1-3 substituents selected from Cl-6-alkyl, C2-6-alkenyl,
cubstituted with 1-3 substituents selected from Acarbox, or R1 and
R2, together with the carbon atom to which they are bound, form a
cyclopentyl, cyclohexyl, or cyclohetyl ring, eg. 2,4-diaminobutanoic
acid and 2,3-diaminopropanoic acid or its salt, or the C-terminal amide
cyclopentyl, cyclohexyl, or cyclohetyl ring, eg. 2,4-diaminobutanoic
acid and 2,3-diaminopropanoic acid or its salt, or the C-terminal
cyclopentyl, cyclohexyl, or cyclohetyl ring, eg. 2,4-diaminobutanoic
acid and 2,3-diaminopropanoic acid or its salt, or the C-terminal
cyclopentyl, cyclohexyl, or cyclohetyl reaching disorder

Glucagon-like peptide-1; GLP-1; exendin-4; antidiabetic; anorectic; antiinflammatory; peptide conjugate; diabetes; obesity; insulin resistance syndrome; eating disorder; hyperglycaemia; metabolic disorder; gastric disease; myocardial infarction. des Pro36-(Lys40(palmitoyl)exendin-4(1-39)-(Lys)7-NH2. 02-MAY-2001 (first entry) AAB69958;

AAB69958 standard; peptide; 46 AA

The present sequence is a peptide conjugate comprising a peptide (X)
which is an exendin at least 90 % homologous to exendin-4, a variant of
exendin comprising 1-5 deletions at positions 34:39 or a Lys at position
40 having a lipophilic substituent, a glucagon-like peptide (GLP-1) (736) or GLP-1 (7-37) having a substitution of D-Ala, Gly or alpha-amino
isobutyric acid for Ala at position 8 and/or having a lipophilic
substituent, and Z, a peptide sequence of 4-20 amino acids covalently
bound to the variant. Each amino acid in Z is selected from A, L, S, T,
Y, O, D, G, K, R, H, M, Orn, and amino acid units of formula -NHCC (R1) (R2)-C(-6)-. R1 and R2 are selected from H, C1-6-alkyl, phenyl and
CC (R1) (R2)-C(-6)-. R1 and R2 are selected from H, C1-6-alkyl, phenyl and
cc (R1) (R2)-C(-6)-. R1 and R2 are selected from H, C1-6-alkyl, phenyl and
CC (R1) (R2)-C(-6)-. R1 and R2 are selected from H, C1-6-alkyl, phenyl and
cc (R1) (R2)-C(-6)-. R1 and R2 are selected from H, C1-6-alkyl, phenyl and
CC (R1) (R2)-C(-6)-. R1 and R2 are selected from R1-6-alkyl, phenyl and
CC (R1) (R2)-C(-6)-. R1 and R2 are selected from R1-6-alkyl, phenyl and
CC (R1) (R2)-C(-6)-. R1 and R2 are selected from R1-6-alkyl, phenyl and
CC substituents selected from Manylamethyl are optionally
CC substituents selected from Manylamethyl are optionally
CC substituents with the carbon intro, sulfono, and carboxy; or R1 and
CC acid and C2,-diaminopropanoic acid or its salt, or the C-terminal amide
CC catedolin 3. The peptide conjugate is useful in the manufacture of a
pharmaccutical composition for use in treatment of type 1 or type 2
Cd abbetes, insulin resistance syndrome, obssity, eating disorder,
CC catechol amines known to increase blood glucose levels
CC catechol amines known to increase blood glucose levels
CC catechol amines including adermalin, glucocortical evels such as peptide agonist of Glucagon-like peptide, useful for decreasing the of blood glucose and for treating diseases like diabetes, obesity catechol amines including adrenalin, glucocorficoids, growth hormone and glucagon. It is useful in regulation of gastric emptying, for stimulating insulin release, for lowering plasma lipid level, and for reducing mortality and morbidity after myocardial infarction Type: P AAB69958 Length: 46 February 4, 2005 13:19 Found using 'seq4' (mohamed337.key) Neve S; Claim 22; Page 66; 83pp; English. The present sequence is a peptide conjugate comprising a peptide (X) which is an exendin at least 90 % homologous to exendin-4, a variant of exendin comprising 1-5 deletions at positions 14-39 or a Lys at position 2 to having a lipophilic substituent, a glucagon-like peptide (GLP-1) (7-36) or GLP-1 (7-37) having a substitution of D-Ala, Gly or alpha-amino comprision a lipophilic substituent, and Z, a peptide sequence of 4-20 amino acids covalently bound to the variant. Each amino acid in Z is selected from A, L, S, T, C, N, O, D, G, K, R, H, M, Orn, and amino acid units of formula -NH-CC (RI) (RI)-C(=0)-. RI and R2 are selected from H, C1-6-alkyl, phenyl and phenyl-methyl, where C1-6-alkyl is optionally substituted with 1-3 substituents selected from halogen, hydroxy, amino, cyano, nitro, sulfono, and carboxy, and phenyl and phenylmethyl are optionally completely are phenylmethyl are optionally completely with the carbon and carboxy, and phenylmethyl are optionally substituted with 1-3 substituents aslected from C1-6-alkyl, C2-6-alkenyl, aubstituted with 1-3 substituents aslected from C1-6-alkyl, C2-6-alkenyl, cyclopentyl, cyano, nitro, sulfono, and carboxy, or R1 and C2 cyclopentyl, cyclohetyl, ring, e.g. 2,4-diaminobutanoic ccd acid and 2,3-diaminopropanoic acid or its salt, or the C-terminal amide cyclopentyl, cyclohetyl, ring, e.g. 2,4-diaminobutanoic ccd caid and 2,3-diaminopropanoic acid or its salt, or the C-terminal amide of the peptide conjugate with the provise that X is not exendin-4 or exendin-3. The peptide conjugate is useful in the manufacture of a craechlo amines including adrenalin, glucoocalevels, such as catechlo amines including adrenalin, glucoocalevels, growth hormone and catechlo amines including adrenalin, glucoocalevels, glucagon. It is useful in regulation of gastric emptying, for stimulating plasma lipid level, and for reducing cc mortality and morbidity after myocardial infarction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel peptide agonist of Glucagon-like peptide, useful for decreasing the level of blood glucose and for treating diseases like diabetes, obesity and eating disorders.
                                                                                               Glucagon-like peptide-1; GLP-1; exendin-4; antidiabetic; anorectic; antilinflammatory; peptide conjugate; diabetes; obesity; insulin resistance syndrome; eating disorder; hyperglycaemia; metabolic disorder; gastric disease; myocardial infarction.
Ly840 (palmitoyl) exendin-4 (1-39) - (Lys) 7-NH2.

Novel peptide agonist of Glucagon-like peptide, useful for decreasing the level of blood glucose and for treating diseases like diabetes, obesity and eating disorders.

Claim 23; Page 67; 83pp; English.

The present sequence is peptide X, a component of a novel peptide conjugate. X is an exendin at least 90 % homologous to exendin-4, a variant of exendin comprising 1-5 deletions at positions 34-39 or a Lys at position 40 having a lipophilic substituent, a glucagon-like peptide (GLP-1) (7-36) or GLP-1 (7-37) having a substituent, a glucagon-like peptide (GLP-1) (7-36) or GLP-1 (7-37) having a substituent of D-Ala, Gly or alpha-amino isobutyric acid for Ala at position 8 and/or having a corporation 1 is selected from having a corporation 8 and/or having 4.20 amino acids. Each amino acid in Z is selected from H. S, T, Y, N, CC (-6)-R and R are selected from H. C.1-6-alkyl bound and phenyl-methyl substituted with 1-3 substituents selected from C.1-6-alkyl, C.1-6-alkyl, halogen, hydroxy, amino, cyano, nitro, sulfono, and carboxy; or R1 and R2, cogether with the graton atom to which they are bound, form a cyclopentyl, cyclohexyl, corporation for use in treatment of carboxy; or exendin-3. The composition for use in treatment of type 1 or type 2 diabetes, insulin composition for use in treatment of type 1 or type 2 diabetes, insulin composition for use in treatment of type 1 or type 2 diabetes, insulin composition for use in treatment of type 1 or type 2 diabetes, insulin composition for use in treatment of type 1 or type 2 diabetes, insulin composition for use in treatment of type 1 or type 2 diabetes, insulin composition for use in treatment of type 1 or type 2 diabetes, insulin composition for use in treatment of type 1 or type 2 diabetes, insulin composition of gastric emptying, for stimulating mortality and morbidity conversed blood glucose levels, such as catechol amines including conversed blood glucose levels elicited by hormones for lowering plasma lipid level, and for reducing mortality processity or ce

The present sequence is peptide X, a component of a novel peptide CC conjugate. X is an exendin at least 90 % homologous to exendin-4, a conjugate. X is an exendin at least 90 % homologous to exendin-4, a variant of exendin comprising 1-5 deletions at positions 34-39 or a Lys CC deletion a lipophilic substituent, a glucagon-like peptide CC dipophilic substituent, a glucagon-like peptide CC dipophilic substituent a nad/or having a lipophilic substituent a nad/or having a cc lipophilic substituent. X is covalently bound to Z, a peptide sequence of 1 pophilic substituent. X is covalently bound to Z, a peptide sequence of CC d-20. R and R 2 are selected from H, C.1-6-alkyl, phenyl and phenyl-1 cc deletion R 2 are selected from H, C.1-6-alkyl, phenyl and phenyl companyl, where Cl-6-alkyl is optionally substituted with 1-3 substituents selected from Cl-6-alkyl is optionally substituted with 1-3 substituents selected from Cl-6-alkyl, C2-6-alkenyl, halogen, hydroxy, substituents selected from Cl-6-alkyl, C2-6-alkenyl, halogen, hydroxy, substituents selected from Cl-6-alkyl, C2-6-alkenyl, halogen, hydroxy, amino, cyano, nitro, sulfono, and carboxy; or R1 and R2, together with the carbon atom to which they are bound, form a cyclopenryl, cyclohexyl, cd and cid or its salt, or the C-terminal amide of the peptide conjugate is useful in the manufacture of a pharmaccutical composition for use in treatment of type 1 or type 2 diabetes, insulin composition for use in treatment of type 1 or type 2 diabetes, composition for use in treatment of type 1 or type 2 diabetes, meaning composition for use in treatment of type 1 or type 2 diabetes, composition for use in treatment of type 1 or type 2 diabetes, method composition for use in treatment of type 1 or type 2 diabetes, composition for use in treatment of type 2 diabetes, insulin composition for use in treatment of type 2 diabetes, insulin composition diabetes and gastric disease. It is useful for treatment of a pharmaccumposition disease blood glucose levels, such as catechol am
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel peptide agonist of Glucagon-like peptide, useful for decreasing the level of blood glucose and for treating diseases like diabetes, obesity and eating disorders.

```
The present sequence is peptide X, a component of a novel peptide CC conjugate. X is an exendin at least 90 % homologous to exendin-4, a conjugate. X is an exendin at least 90 % homologous to exendin-4, a variant of exendin comprising 1-5 deletions at positions 34-39 or a Lys CC at position 40 having a lipophilic substituent, a glucagon-like peptide CC (GLP-1) (7-36) or GLP-1 (7-37) having a substitution of D-Ala, Gly or alpha-amino isobutyric acid for Ala at position 8 and/or having a CC (Ipophilic substituent. X is covalently bound to Z, a peptide sequence of Ipophilic substituent. X is covalently bound to Z, a peptide sequence of C, C, R, M, M, Orn, and amino acid unite of formla -NH-C(R1) (R2)-CC (-0)-. R and R2 are selected from H, C1-6-alkyl, phenyl and phenyl completelyl, where C1-6-alkyl is optionally substituted with 1-3 substituents selected from Anlogen, hydroxy, and phenyl and phenylmethyl are optionally substituted with 1-3 cubstituents selected from C1-6-alkyl, are optionally substituted with 1-3 cubstituents selected from C1-6-alkyl, are optionally substituted with 1-3 cubstituents or anino, cyano, nitro, authon C1-6-alkyl, are optionally substituted with 1-3 cubstituents acident or which they are bound, form a cyclopencyl, cyclobexyl, creation atom to which they are bound, form a cyclopencyl, cyclobexyl, or cyclobeptyl ring, e.g. 2,4-diaminobutanoic acid and 2,3-creative complexed and comprehensial amide of the peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel peptide agonist of Glucagon-like peptide, useful for decreasing the level of blood glucose and for treating diseases like diabetes, obesity and eating disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                            Glucagon-like peptide-1; GLP-1; exendin-4; antidiabetic; anorectic; antinflammatory; peptide conjugate; diabetes; obesity; insulin resistance syndrome; eating disorder; hyperglycaemia; metabolic disorder; gastric disease; myocardial infarction.

conjugate with the proviso that X is not exendin-4 or exendin-3. The peptide conjugate is useful in the manufacture of a pharmaceutical composition for use in treatment of type 1 or type 2 diabetes, insulin resistance syndrome, obesity, eating disorder, hyperglycaemia, metabolic disorders and gastric disease. It is useful for treating disease states associated with elevated blood glucose levels elicited by hormones known to increase blood glucose levels, such as catechol amines including adrenalin, glucocorticoids, growth hormone and glucagon. It is useful in regulation of gastric emptying, for stimulating insulin release, for lowering plasma lipid level, and for reducing mortality and morbidity after myocardial infarction 88666666666688888

WPI; 2001-159381/16.

Novel peptide agonist of Glucagon-like peptide, useful for decreasing the level of blood glucose and for treating diseases like diabetes, obesity and eating disorders.

Claim 23; Page 67; 83pp; English.

The present sequence is peptide X, a component of a novel peptide conjugate. X is an exendin at least 90 % homologous to exendin-4, a variant of exendin comprising 1-5 deletions at positions 34-39 or a Lys at position 40 having a lipophilic substituent, a glucagon-like peptide (GLP-1) (7-36) or GLP-1 (7-37) having a substitution of D-Ala, Gly or alpha-amino isobutyric acid for Ala at position 8 and/or having a lipophilic substituent. X is covalently bound to Z, a peptide sequence of 1:pophilic substituent. X is covalently bound to Z, a peptide sequence of 4-20 amino acids. Each amino acid in Z is selected from A, L, S, T, Y, N, Q, D, G, K, R, M, Orn, and amino acid units of formula -NH-C(R1) (R2) - C(=0) -. R1 and R2 are selected from H, C1-6-alkyl, phenyl and phenyl-

methyl, where Cl-6-alkyl is optionally substituted with 1-3 substituents selected from halogen, hydroxy, amino, cyano, nitro, sulfono, and carboxy, and phenyl and phenylmethyl are optionally substituted with 1-3 substituents selected from Cl-6-alkyl, Cl-6-alkenyl, halogen, hydroxy, amino, cyano, nitro, sulfono, and carboxy; or R1 and R2, together with the carbon atom to which they are bound, form a cyclopentyl, cyclohexyl, or cycloheptyl ring, e.g. 2,4-diaminobutanoic acid and 2,3- diaminopropanoic acid or its salt, or the C-terminal amide of the peptide conjugate with the proviso that X is not exendin-4 or exendin-3. The peptide conjugate is useful in the manufacture of a pharmacutical composition for use in treatment of type 1 or type 2 diabetes, insulin resistance syndrome, obesity, eating disorder, hyperslycaemia, metabolic disorders and gastric disease. It is useful for treating disease states associated with elevated blood glucos levels elicited by hormones known to increase blood glucose levels, such as catechol amines including afrenalin, glucocorticoids, growth hormone and glucaen; in regulation of gastric emptying, for stimulating insulin release, for lowering plasma lipid level, and for reducing mortality and morbidity after myocardial infarction.

```
The present sequence is a peptide conjugate comprising a peptide (X) which is an exendin at least 90 % homologous to exendin-4, a variant of exendin comprising 1-5 deletions at positions 34-39 or a Lys at position 40 having a lipophilic substituent, a glucagon-like peptide (GLP-1) (7-36) or GLP-1 (7-37) having a substitution of D-Ala, Gly or alpha-amino CC isobutrivic acid for Ala at position 8 and/or having a lipophilic substituent, and Z, a peptide sequence of 4-20 amino acids covalently bound to the variant. Each amino acid in Z is selected from A, L, S, T, Y, N, Q, D, G, K, R, H, M, Orn, and amino acid units of formula -NH-CC (RI) (RIZ)-(C=0). RI and R2 are selected from H, Cl-6-alkyl, phenyl and phenyl-methyl, where Cl-6-alkyl is optionally substituted with 1-3 substituents selected from Hordroxy, amino, cyano, nitro, sulfono, and carboxy, and phenyl-methyl are optionally substituted with 1-3 substituents selected from Cl-6-alkyl, C2-6-alkenyl, alogen, hydroxy, amino, cyano, nitro, sulfono, and carboxy, and phenyl-methyl are optionally cyclopentyl, cyclohexyl, or cycloheptyl ring, e.g. 2,4-diaminobutanoic coid and 2,3-diaminopropanoic acid or its salt, or the C-terminal amide cyclopentyl, cyclohexyl, or cycloheptyl ring, e.g. 2,4-diaminobutanoic acid and 2,3-diaminopropanoic acid or its salt, or the C-terminal amide of the peptide conjugate with the proviso that X is not exendin-4 or exendin-3. The peptide conjugate is useful in the manufacture of a cycloheptyl cing, e.g. 2,4-diaminobutanoic acid and 2,3-diaminopropanoic acid or its salt, or the C-terminal amide of pharmaceutical composition for use in treatment of type 1 or type 2 diabetes, insulin resistance syndrome, obesity, eating disorder, such as creating disease states associated with elevated blood glucose levels created and morphidity after myocardial infarction and for reducing plasma lipid level, and for reducing plasma lipid level, and for reducing plasma lipid level, and for reducing corrections.
                                                                                                                                                                                                                Novel peptide agonist of Glucagon-like peptide, useful for decreasing the level of blood glucose and for treating diseases like diabetes, obesity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Glucagon-like peptide-1; GLP-1; exendin-4; antidiabetic; anorectic; antiinflammatory; peptide conjugate; diabetes; obesity; insulin resistance syndrome; eating disorder; hyperglycaemia; metabolic disorder; gastric disease; myocardial infarction.

The present sequence is a peptide conjugate comprising a peptide (X) which is an exendin at least 90 % homologous to exendin-4, a variant of cerendin comprising 1-5 deletions at positions 34-39 or a Lys at position 40 having a lipophilic substituent, a glucagon-like peptide (GLP-1) (7-37) having a substituent, a glucagon-like peptide (GLP-1) (7-36) or GLP-1 (7-37) having a substituent, a glucagon-like peptide (GLP-1) (7-37) having a substituent, and Z, a peptide sequence of 4-20 amino acide (GLP-1) (7-37) having a substituent. Each amino acid in Z is selected from A, L, S, T, C, D, D, G, K, R, H, M, Orn, and amino acid units of formula -NH-CC (RI) (RI) (RI) -C(-6)-. RI and R2 are selected from H, CI-6-alkyl, phenyl methyl, where CI-6-alkyl is optionally substituted with 1-3 substituents selected from H, CI-6-alkyl, CC sulfono, and carboxy, and phenylmethyl are optionally substituted with 1-3 substituents selected from CI-6-alkyl, C2-6-alkenyl, cyclohexyl and phenylmethyl are optionally substituted with 1-3 substituents selected from CI-6-alkyl, C2-6-alkenyl, cyclohexyl, or cycloheptyl ring, e.g. 2,4-diaminobutanoic cyclopentyl, cyclohexyl or cycloheptyl ring, e.g. 2,4-diaminobutanoic cyclopentyl, cyclohexyl, or cycloheptyl ring, e.g. 2,4-diaminobutanoic cyclopentyl, cyclohexyl or cycloheptyl ring, e.g. 2,4-diaminobutanoic cyclopentyl ring, e.g. 2,4-diaminopropanoic acid or its salt, or tyclopentyl ring, e.g. 2,4-diaminobutanoic cy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           peptide agonist of Glucagon-like peptide, useful for decreasing the of blood glucose and for treating diseases like diabetes, obesity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAB69969 Length: 44 February 4, 2005 13:19 Type: P Check: 5122 Found using 'seq4' (mohamed337.key)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         HGEGTFTSDLSKOMEEEAVRLFIEWLKNGGPSSGAPPSKKKKKK

```
The present sequence is peptide X, a component of a novel peptide conjugate. X is an exendin at least 90 % homologous to exendin-4, a variant of exendin comprising 1-5 deletions at positions 34-39 or a Lys at position 40 having a lipophilic substitution of D-Ala, Gly or alpha-amino isobutyric acid for Ala at position 8 and/or having a lipophilic substitution of D-Ala, Gly or (GLP-1) (7-36) or GLP-1 (7-37) having a substitution of D-Ala, Gly or Lipophilic substituent. X is covalently bound to Z, a peptide sequence of 1-20 amino acids. Each amino acid in Z is selected from A, L, S, T, Y, N, C, C, O, D, G, K, R, H, M, Orn, and amino acid units of formula -NH-C(R1) (R2)-CC (-6)-. R1 and R2 are selected from H, C1-6-alkyl, phenyl and phenyl and phenyl and phenylmethyl substituted with 1-3 substituents selected from Anlogon, hydroxy, amino, cyano, nitro, sulfono, and carboxy, and phenyl and phenylmethyl are optionally substituted with 1-3 substituents selected from C1-6-alkyl, C2-6-alkenyl, halogen, and carboxy, amino, cyano, nitro, sulfono, and carboxy, or R1 and R2, together with the acid or its salt, or the C-terminal amide of the peptide or cycloheptyl ring, e.g. 2,4-diaminobutanoic acid and 2,3-diaminopropanoic acid or its salt, or the C-terminal amide of the peptide conjugate with the proviso that X is not exendin-4 or exendin-3. The composition for use in treatment of type 1 or type 2 diabetes, insulin conjugate with elevated blood glucose levels elicited by hormones known to increase blood glucose levels elicited by hormones known to increase blood glucose levels, such as catechol amines including adenaling plasma lipid level, and for reducing mortality and morbidity of the perior of elevels, and sected are all such as catechol amines including capture and capture manyland and scatechol amines including capture more all sevels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel peptide agonist of Glucagon-like peptide, useful for decreasing the
level of blood glucose and for treating diseases like diabetes, obesity
                                                                                                 Glucagon-like peptide-1; GLP-1; exendin-4; antidiabetic; anorectic; antilinflammatory; peptide conjugate; diabetes; obesity; insulin resistance syndrome; eating disorder; hyperglycaemia; metabolic disorder; gastric disease; myocardial infarction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Neve S;

Novel peptide agonist of Glucagon-like peptide, useful for decreasing the level of blood glucose and for treating diseases like diabetes, obesity and eating disorders.

Claim 22; Page 66; 83pp; English.

The present sequence is a peptide conjugate comprising a peptide (X) which is an exendin at least 90 % homologous to exendin-4, a variant of exendin comprising 1-5 deletions at positions 34.39 or a Lys at position 36.30 or GLP-1 (7-37) having a substituent, a glucagon-like peptide (GLP-1) (7-36) or GLP-1 (7-37) having a substitution of D-Ala, Gly or alpha-amino isobutyric acid for Ala at position 8 and/or having a lipophilic comparant. Each amino acid in Z is selected from 4, L, S, T, Y, N, O, D, G, K, R, H, M, Orn, and amino acid units of formula -NH-cC (RI)(RI)(RI)-(1-6). RI and R2 are selected from H, Cl-6-alkyl, phenyl and phenyl-methyl, where Cl-6-alkyl is optionally substituted with 1-3 substituents selected from halogen, hydroxy, amino, cyano, nitro, sulfono, and carboxy, and phenyl and phenylmethyl are optionally competituted with 1-3 substituents selected from Cl-6-alkyl, C2-6-alkenyl, halogen, hydroxy, amino, cyano, nitro, sulfono, and carboxy, and phenylmethyl are optionally cyclopentyl, cyclohexyl, or cycloheptyl ring, e.g. 2,4-diaminobutanoic cyclopentyl, e.g. musulin resistance syndrome, obesity, eating disease states associated with elevated blood glucose levels creating disease states associated with elevated blood glucose levels citred by hormones known to increase blood glucose levels, glucagon. It is useful in regulation of gastric emptying, growth hormone and cutedily and morbidity after myocardial infarction

Novel peptide agonist of Glucagon-like peptide, useful for decreasing the level of blood glucose and for treating diseases like diabetes, obesity and eating disorders.

Claim 22; Page 66; 83pp; English.

The present sequence is a peptide conjugate comprising a peptide (X) which is an exendin at least 90 % homologous to exendin-4, a variant of exendin comprising 1-5 deletions at positions 34-39 or a Lye at position to having a lipophilic substituent, a glucagon-like peptide (GLP-1) (7-36) or GLP-1 (7-37) having a substitution of D-Ala, Gly or alpha-amino isobstituent, and Z, a peptide sequence of 4-20 amino acids covalently bound to the variant. Bach amino acid in Z is selected from A, L, S, T, Y, N, O, D, G, K, R, H, M, Orn, and amino acid units of formula -NH-C(R1) (R2)-C(-6)-. R1 and R2 are selected from H, C1-6-alkyl, phenyl and phenyl-methyl, where C1-6-alkyl is optionally substituted with 1-3 substituents selected from C1-6-alkyl, c2-6-alkenyl, substituted with 1-3 substituents selected from C1-6-alkyl, C2-6-alkenyl, and ogen, hydroxy, and phenyl and phenyl and phenyl and phenyl and phenyl and phenyl and carboxy; or R1 and R2 to cyclopentyl, cyclohexyl, or cyano, nitro, sulfono, and carboxy; or R1 and R2 to copentyl, cyclohexyl, or cyclopetyl ring, e.g. 2,4-diaminobutanoic acid and 2,3-diaminopropanoic acid or its salt, or the Cterminal amide of the peptide conjugate with the proviso that X is not exendin-4 or

exendin-3. The peptide conjugate is useful in the manufacture of a pharmaceutical composition for use in treatment of type 1 or type 2 diabetes, insulin resistance syndrome, obesity, eating disorder, hyperglycaemia, metabolic disorders and gastric disease. It is useful for treating disease states associated with elevated blood glucose levels elicited by hormones known to increase blood glucose levels, such as catechol amines including adrenalin, glucocorticoids, growth hormone and glucagon. It is useful in regulation of gastric emptying, for stimulating mosulin release, for lowering plasma lipid level, and for reducing mortality and morbidity after myocardial infarction 888888888888888

The present sequence is a peptide conjugate comprising a peptide (X) which is an exendin at least 90 % homologous to exendin-4, a variant of exendin comprising 1-5 deletions at positions 34-39 or a Lys at position 34-39 or a Lys at position 36 or GLP-1 (7-37) having a substituent, a glucagon-like peptide (GLP-1) (7-36) or GLP-1 (7-37) having a substituent, a glucagon-like peptide (GLP-1) (7-37) having a substituent a substituent, a mad Z, a peptide sequence of 4-20 amino acids covalently bound to the variant. Each amino acid in Z is selected from A, L, S, T, Y, N, Q, D, G, K, R, H, M, Orn, and amino acid units of formula -NH-CC (RI)[X2)-(C-6)-. Il and R2 are selected from H, Cl-6-alkyl, phenyl and phenyl-methyl, where Cl-6-alkyl is optionally substituent with 1-3 substituents aelected from H, Cl-6-alkyl, phenyl and phenylmethyl are optionally substituent with 1-3 substituents aelected from Cl-6-alkyl, C2-6-alkenyl, alogen, hydroxy, amino, cyano, nitro, sulfono, and carboxy, and phenyl and phenylmethyl are optionally cyclopentyl, cyclohexyl, or cycloheptyl ring, e.g. 2,4-diaminobutanoic codd and 2,3-diaminopropanoic acid or its salt, or the C-terminal amide cyclopentyl, cyclohexyl, or cycloheptyl ring, e.g. 2,4-diaminobutanoic codd and 2,3-diaminopropanoic acid or its salt, or the C-terminal amide cyclopentyl, cyclohexyl, or cycloheptyl ring, e.g. 2,4-diaminobutanoic codd and 2,3-diaminopropanoic acid or its salt, or the C-terminal composition for use in treatment of type 1 or type 2 diabetes, insulin resistance syndrome, obesity, eating disease states associated with elevated blood glucose levels cicted by hormones known to increase blood glucose levels, such as catechin amines including adrenalin, glucoretricoide, growth hormone and catechin amines including adrenalin, glucoretricoide, growth hormone and cuteding disease states associated with elevated blood glucose levels elected by hormones known to increase blood glucose levels, insulin release, for lowering plasma lipid level, and for reducing cyclopers ar level of blood glucose and for treating diseases like diabetes, obesity and eating disorders. Claim 22; Page 67; 83pp; English.

Gila monster venom exendin 3 peptide fragment.

Fri Feb

```
The invention is directed towards the amelioration of organ tissue injury caused by reperfusion of blood flow after ischemia. The method involves administering a composition containing a compound which binds to a receptor for glucagon-like peptide-1 (GLP-1) in a carrier. GLP-1 effectively enhances peripheral glucose uptake without inducing dangerous hypoglycemia. GLP-1 strongly suppresses glucagon secretion, independent of its insuliniotropic action and powerfully reduces plasma free fatty acid (FFA) level having major toxic mechanism during myocardial ischemia, acid (FFA) level having major toxic mechanism during myocardial ischemia, acid (FFA) level having area be accomplished with insulin. The method is without side effects normally attendant with therapies presently available. GLP-1 suppresses paracrine by intra-islet release of insulin or somatostatin. GLP-1 is unique in its capacity to simultaneously. Stimulate insulin secretion and inhibit glucagon release. The present sequence represents a gila monster venom exendin 3 peptide fragment, homologous to a mammalian GLP-1 peptide fragment

The invention is directed towards the amelioration of organ tissue injury caused by reperfusion of blood flow after ischemia. The method involves administering a composition containing a compound which binds to a receptor for glucagon-like peptide-1 (Gip-1) in a carrier. Gip-1 effectively enhances peripheral glucose uptake without inducing dangerous hypoglycemia. Gip-1 strongly suppresses glucagon secretion, independent of its insuliniotropic action and powerfully reduces plasma free fatty, acid (FFA) level having major toxic mechanism during myocardial ischemia, substantially more than can be accomplished with insulin. The method is ubstantially more than can be accomplished with insulin. The method is available. Gip-1 suppresses paracrine by intra-islet release of insulin or somatostatin. Gip-1 is unique in its capacity to simultaneously crimulate insulin secretion and inhibit glucagon release. The present sequence represents a glia monster venom exendin 4 peptide fragment, homologous to a mammalian Gip-1 peptide fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Exendin-3; antilipemic; cardiant; triglyceride; inotropic; diuretic;

                                                                                                                                                                              The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inotropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. They exendin-3 peptide from Heloderma horridum
                                                                                                                                                                                                                                                                                    AAE08345 Length: 39 February 4, 2005 13:19 Type: P Check: 9591 Found using 'seq4' (mohamed337.key)

The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exandin or an exendin agonist. Exendins have inotropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present sequence is an agonist of exendin, exendin-4 (residues 1-30) from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Use of exendin and exendin agonist compounds for modulating triglyceride
levels, and treating heart disease and dyslipidemia.
Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                       The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Exendin-4; antilipemic; cardiant; triglyceride; inotropic; diuretic; coronary heart disease; dyslipidaemia.
                                                                                                                                                                                     The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inctropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat concary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present sequence is exendin-4 peptide from Heloderma suspectum
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAE08346 Length: 39 February 4, 2005 13:19 Type: P Check: 9570 Found using 'seq4' (mohamed337.key)

Heloderma suspectum modified exendin-4 amide peptide (residues 1-28)#1.

to: 28

from: 1

TOIG of: aae08352 check: 151

AAE08352 standard; peptide; 28 AA

01-NOV-2001 (first entry)

AAE08352

cardiant, triglyceride, inotropic, diuretic, dyslipidaemia.

Exendin-4; antilipemic; coronary heart disease;

Heloderma suspectum

/note= "C-terminal amide"

```
Use of exendin and exendin agonist compounds for modulating triglyceride
levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inotropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present sequence is an agonist of exendin, exendin-4 amide (residues 1-
                                                                                                                                                                                                                                                                                                                                            Exendin-4; antilipemic; cardiant; triglyceride; inotropic; diuretic; coronary heart disease; dyslipidaemia.
                                                                                                                            match found in sequence:

Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Exendin-4; antilipemic; cardiant; triglyceride; inotropic; diuretic; coronary heart disease; dyslipidaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have incropic and directic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. They exent esquence is Heloderma suspectum modified exendin-4 amide (residues 1-28) which is an agonist of exendin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAE08352 Length: 28 February 4, 2005 13:19 Type: P Check: 151 Found using 'seq4' (mohamed337.key)

Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                    Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                                                 The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inctropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin: Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    :
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Exendin agonist; antilipemic; cardiant; triglyceride; inotropic; diuretic; coronary heart disease; dyslipidaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAE08354 Length: 39 February 4, 2005 13:19 Type: P Check: 9556 Found using 'seq4' (mohamed337.key)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  to: 39

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAE08355;
The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have intorropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present sequence is Heloderma suspectum modified exendin-4 peptide which
                                                                                                                                                                                                                                                                                                                                                                                                                 Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        yonist; antilipemic; cardiant; triglyceride; inotropic; coronary heart disease; dyslipidaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Check: 9131

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Use of exendin and exendin agonist compounds for modulating triglyceride
levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inotropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coroneart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present

Exendins have inctropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin, Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Exendin agonist; antilipemic; cardiant; triglyceride; inotropic; diuretic; coronary heart disease; dyslipidaemia.

Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inotropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification

Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inctropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Exendin agonist; antilipemic; cardiant; triglyceride; inotropic; diuretic; coronary heart disease; dyslipidaemia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAE08360;
  exendin and exendin agonist compounds for modulating triglyceride, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inctropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                                                                                                                                                                                                                                                    Exendin agonist; antilipemic; cardiant; triglyceride; inotropic; diuretic; coronary heart disease; dyslipidaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAE08358 Length: 39 February 4, 2005 13:19 Type: P Check: 9567

of exendin and exendin agonist compounds for modulating triglyceride sls, and treating heart disease and dyslipidemia.
                                                                                                                                                          The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inctropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum trigly/ceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial trigly/ceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                                                                                                                                                                                                                                                                                                                       |-----|

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     19-JUL-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAE08362;
                                                                                                            levels,
                                                                                            Use
 Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                                                                                             The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inctropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Exendin agonist; antilipemic; cardiant; triglyceride; inotropic; diuretic; coronary heart disease; dyslipidaemia.

The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have incropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification

Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inctropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification

Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have incirople and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                                                   Exendin agonist; antilipemic; cardiant; triglyceride; inotropic; diuretic; coronary heart disease; dyslipidaemia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inctropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                                                                                                                                                                                                                                              Exendin agonist; antilipemic; cardiant; triglyceride; inotropic; diuretic; coronary heart disease; dyslipidaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAE08365 Length: 39 February 4, 2005 13:19 Type: P Check: 9251 Found using 'seq4' (mohamed337.key)

Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                                                                                                                                    The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inotropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Exendin agonist; antilipemic; cardiant; triglyceride; inotropic; diuretic; coronary heart disease; dyslipidaemia.

                  19-JUL-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAE08369;
Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inctropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Exendin agonist; antilipemic; cardiant; triglyceride; inotropic; diuretic; coronary heart disease; dyslipidaemia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                          suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                                                      The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inotropic and diuretic effects. They
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inotropic and diuretic effects. They euppress the secretion of glucagon. Exendin and its agonists have a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Exendin agonist; antilipemic; cardiant; triglyceride; inotropic; diuretic; coronary heart disease; dyslipidaemia.

Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inctropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Exendin agonist, antilipemic; cardiant; triglyceride; inotropic; diuretic; coronary heart disease; dyslipidaemia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Modified-site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        19-JUL-2001.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAE08371;
```

aae08373 ; Exendin agonist peptide #20.

```
Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inctropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Exendin agonist, antilipemic; cardiant, triglyceride; inotropic;
diuretic; coronary heart disease; dyslipidaemia.

Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inotropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                                                                                              Exendin agonist; antilipemic; cardiant; triglyceride; inotropic; diuretic; coronary heart disease; dyslipidaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Type: P Check: 9546

Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inctropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptied sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Exendin agonist; antilipemic; cardiant; triglyceride; inotropic; diuretic; coronary heart disease; dyslipidaemia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAE08376;
  LILLLIAXSXXXXXXXXXXXXX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inotropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Exendin agonist; antilipemic; cardiant; triglyceride; inotropic; diuretic; coronary heart disease; dyslipidaemia.

Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                                                                                       The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inctropic and diuvetic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Exendin agonist; antilipemic; cardiant; triglyceride; inotropic; diuretic; coronary heart disease; dyslipidaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Check: 458
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Type: P

Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                                The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inotropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Exendin agonist; antilipemic; cardiant; triglyceride; inotropic; diuretic; coronary heart disease; dyslipidaemia.

Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                      The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have inctropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Exendin agonist; antilipemic; cardiant; triglyceride; inotropic; diuretic; coronary heart disease; dyslipidaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             to: 39

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAE08380;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          aae08380
  Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                                                                                                                                                                   The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have incropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide any agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Exendin agonist; antilipemic; cardiant; triglyceride; inotropic; diuretic; coronary heart disease; dyslipidaemia.

Use of exendin and exendin agonist compounds for modulating triglyceride levels, and treating heart disease and dyslipidemia.
                                                                                                      The patent discloses a method for modulating plasma or postprandial triglyceride and other lipid levels by administering exendin or an exendin agonist. Exendins have incropic and diuretic effects. They suppress the secretion of glucagon. Exendin and its agonists have a significant effect on the reduction of blood serum triglyceride concentrations. They are used to treat coronary heart disease and dyslipidaemia, and for modifying postprandial triglyceride levels. The present peptide sequence is an agonist of exendin. Note: The present sequence is not shown in the specification but is derived from SEQ ID NO:3 shown in page 17 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Exendin agonist; antilipemic; cardiant; triglyceride; inotropic;
diuretic; coronary heart disease; dyslipidaemia.
